n describes isolated Tumor Necrosis Factor (TNF) family peptides: APO4, APO6, APO8 and APO9 or their active d'isolated TWP related ligands in and 3 (TNRL1 and TNRL3) or fragments. APO4 is useful for diagnosing prostate cancer by evels of APO4 in an individual. Prostate cancer can also be APO8 selective binding agents linked to a therapeutic polypeptides are also useful for identifying selective polypeptides are also useful for identifying selective s. useful in diagnosis/treatment of disease by binding of s. useful in diagnosis/treatment of disease by binding of the call surface. The binding is preferably performed in lypeptides/ active fragment which is extracellular, or the call surface. The binding is preferably performed in lypeptides/ active fragments are also useful for screening and antagonists by binding and observing the changer in APO4 ective pharmacological agence useful in diagnosis or disease are also identified using APO4 polypeptides/ active lampic domain of APO4 and detecting a change in level of APO4 is method is performed in vivo or in vitro. APO polypeptides is method is performed in vivo or in vitro. APO polypeptides is anosis/treatment of developmental or gestational duced apoptosis

싦  $\widetilde{F_{2}}$ 

The present sequence is that of cDNA clone DNA30879-1152 (ATCC 2) encoding human PRO207 (see AAY95338), which shows homology to ser members of the tumourn necrosis factor family, especially human lymphotoxin (23.4%). The CDNA was identified in a foetal kidney (library following identification of an expressed sequence tag will homology to human Apo-2 ligand. A claimed method for inhibiting growth of a tumour call comprises exposing the tumor cell to PRO2 PRO207, PRO319, PRO219, PRO221, PRO224, PRO328, PRO301, PRO526, PRO356, PRO356, PRO356, PRO356, Rose AAY95337-49), their agonists or chollypeptides incorporating them. The tumour is especially a cancer selected from breast, ovarian, renal, colorectal, uterine, prostitude, bladder and central nervous system cancer, melanoma and les Nucleic acids encoding PRO179 etc. are used in the recombinant pr

```
The present sequence is that of a polynucleotide encoding a non-R member of the tumour necrosis factor (TMP) superfamily. The invenprovides non-naturally-occurring proteins that contain one or external surface loops of RANKL (see ABR42066-70) in combination betacrologus protein core obtained from a non-RANKL member of the superfamily. Also provided are polynucleotides encoding such prot The proteins bind to RANK, acting as mimics of RANKL. They can be ostandance bone formation by either inhibiting bone resorption or in costeogenesis, thus providing treatment for diseases or conditions characterised by loss of bone mass
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New RANKL mimic comprising a core, and at least one external loop for enhancing processes of bone formation or inhibiting bone reso thus providing treatments for disease or condition characterized.

The present sequence is that of a polynucleotide encoding human. The invention relates to compositions comprising heterotrimeric of tumour necrosis factor (TNF) ligand family members, and their the detection, prevention and treatment of disease. In one embod the heterotrimeric complex comprises full-length or extracellular portions of TWEAK and full-length or extracellular portions of oligand family members, preferably VEGI or VEGI-SV. The heterotrim complexes of the invention are useful for treating an autoimmune cancer or osteoporosis, and particularly for inhibiting cancer or proliferation, increasing B cell proliferation, or inducing apop T cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New heteromultimeric complex having a first polypeptide member o tumor necrosis factor (TNF) ligand family, and a second different of TNF ligand family, useful for treating cancer, osteoporosis on

```
The invention relates to an isolated nucleic acid molecule encoditumour necrosis factor family ligand. A composition comprising th isolated antibody or its fragment is used for treating an individned need of decreased level of endokine alpha activity. The endokine polypeptide present in a heterotrimeric complex is used for treat individual having a disorder associated with excessive bone resor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                e.g. osteoporoeis, Paget's disease or arterial calcification. Treindividual having a disorder associated with insufficient bone recomprises administering an endokine alpha antagonist, which is the antibody that binds specifically to endokine alpha polypeptide. I present sequence represents a cDNA encoding a tumour necrosis fac

Five hundred and ninety two polynucleotides derived from a varie human tissue sources which encode secreted proteins, useful for immune deficiencies and disorders such as autoimmune disorders.

Claim 1; Page 82; 372pp; English.

**5** 8

12

The invention relates to 592 polynucleotides which have been der a variety of human tissue sources and which encode novel secrete proteins. The polynucleotides can be used as probes for the identification and isolation of full length cDNA and genomic DNA polynucleotides and proteins can also be used as nutritional suppolynucleotides and proteins can also be used as nutritional suppolynucleotides and proteins can also be used as nutritional suppolynucleotides such as viral infections, bacterial infections, infections, autoimmune disorders (e.g. rhewmatcid arthritis, multiplections, autoimmune thyroiditis and diabetes) and allergic real and conditions (e.g. asthma). They are also useful for treating neurodegenerative diseases (e.g. Alzheimer's disease, Parkinson' disease), liver fibrosis, coagulation disorders (e.g. hammatcry disorders (e.g. Crohn's disease) and tumours. They useful for tissue regeneration, for wound healing and in the tre hammatopolseis and for treating myeloid or lymphoid cell deficie can manacopolseis and for treating myeloid or lymphoid cell deficie can be also selected to the inv

The sequence is that encoding human tumour necrosis factor related (TRELL). TRELL or active fragments can be included with a carrier pharmaceutical compositions to treat cancer, autoimmune diseases immune responses to tissue grafts, or to stimulate or suppress the system. It is useful to screen for TRELL receptors, by labelling v detectable label and screening compositions for binding. Agents interfering with TRELL-receptor binding can also be screened for then be administered, optionally with interferon- gamma, to induce death or treat, suppress or alter immune responses (especially inhuman adenocarcinoma cells) involving a signal pathway between TRI its receptor. The DNA sequence can be used in gene therapy for TRI related disorders in mammals (especially humans), e.g. tumours,

The present invention relates to extracellular signal molecules, particularly members of tumour necrosis factor (TNF) family molec designated as TREPA (TNF related endothelium proliferative agent) Soluble biologically active TREPA are used to treat TREPA-associa diseases, tumours or metastases. TREPA is used for inducing anglo in human for promoting wound healing and for vascularising grafte for successful grafting and to promote tissue grafts. The present sequence is a CDNA clone ID #690050 encoding human TREPA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Inducing angiogenesis in mammal at desired sites for promoting won healing, by administering soluble fragment of extracellular domaintumor necrosis factor related endothelium proliferative agent pro

WPI: 1999-205191/17. P-PSDB; AAW93590 New Tumor Necrosis Factor family receptor polypeptides and ligar useful for diagnosis and treatment of prostate cancer and develc or gestational abnormalities.

Example VII; Fig 13A; 156pp; English.

This invention describes isolated Tumor Necrosis Factor (TNF) fareceptor polypeptides: APO4, APO6, APO8 and APO9 or their active fragments, and isolated TNF related ligands 1 and 3 TURL1 and 1 their active fragments. APO4 is useful for diagnosing prostate cancer can treated using APO4 selective binding agents linked to a theraper moiety. APO4 polypeptides are also useful for identifying select binding agents to the polypeptides are also useful for identifying select binding agents to the polypeptide/active fragment which is extracellular expressed on the cell surface. The binding ap preferably perform vivo. APO4 polypeptides/ active fragments are also useful for section and antagonists by binding and observing the change activity. Effective pharmacological agents useful in diagnosis corrections and APO4 signal transducer molecules that specifically with a cytoplasmic domain of APO4 and detecting a change in leve

2:

The sequence represents a DNA from the expression vector pDC409-L:
which encodes a fusion protein comprising a growth hormone leader
leucine zipper multimerisation domain, and the extracellular doma
thuman TWEAK. The fusion protein was used in the isolation of human
receptor (TWEAKR) expressing chones from a COS cell human cDNA li:
The TWEAK protein is a member of the tumour necrosis factor (TME)
and induces angiogenesis. TWEAKR may therefore be used to screen
develop TWEAKR agonists and antagonists for the modulation of
angiogenesis, to be used in the treatment and diagnosis of human
corporaterised by angiogenesis include ocular disorders

TymaRA induces anajogenesis and proliferation of endothelial cell
"J. Biol. Chem. 274:8459(1999)
-!- FUNCTION: Binds to FN14 and possibly also to TNRFSF12/APO3.
inducer of apoptosis in some cell types. Mediates NF-KappaB
activation. May promote angiogenesis and the proliferation of endothelial cells. -!- SUBGINIT: Homotrimer (Potential).
-!- SUBGELDULAR LOCATION: Type II membrane protein and secreted.
-!- IISSUB SEPECIFICITY: Highly expressed in adult heart, pancrea skeletal muscle, brain, colon, small intestine, lung, ovary, prostate, spleen, lymph node, appendix and peripheral blood lymphocytes. Low expression in kidney, testis, liver, placen thymus and bone marrow. Also detected in fetal kidney, liver by proteolytic processing.
-!-SIMILANITY: Belongs to the tumor necrosis factor family.
-!- CAUTION: Ref. 3 sequence differs from that shown due to a frameshift in position 125. lung and brain.
-!- PTM: The soluble form derives from the membrane form

putative chicken CD40 ligand.";
R-2003) to the EMBL/GenBank/DDBJ databases.
Cytokine that binds to TNFRSF5. Mediates B-cell
Cyton in the absence of co-stimulus as well as IgE
in in the presence of IL-4. Involved in immunoglobulin
tching (By similarity).

I. FUNCTION: Cytokine that binds to TNPRSFIIB/OPG and to
TNPRSFIIA/RANK. Obsteoclast differentiation and activation fa
Augments the ability of dendritic cells to stimulate naive T
proliferation. May be an important regulator of interactions
between T cells and dendritic cells and may play a role in t
regulation of the T cell-dependent immune response. May also
an important role in enhanced bone-resorption in humoral by proteolytic processing. The cleavage may be catalyzed by ADAM1. A further shorter soluble form was observed.
DISEASE: Deficiency in TNESF11 results in failure to form lo alveolar mammary structures during pregnancy, resulting in of newborns. Trance-deficient mice show severe osteopetrosis no osteoclasts, marrow spaces, or tooth eruption, and exhibit profound growth retardation at several skeletal sites, inclute limbs, skull, and vertebrae and have marked chondrodysplyith thick, irregular growth plates and a relative increase similarity: Belongs to the tumor necrosis factor family. "Adjuvant properties of canine CD40L.";
Submitted (AUG-1998) to the EMBL/GenBank/DDBJ databases.

"Submitted (AUG-1998) to the EMBL/GenBank/DDBJ databases.

"PUNCTION: Cytokine that binds to TNFRSFS: Mediates B-cell proliferation in the absence of IL-4. Involved in immunoglobulic class switching (By similarity).

-!- SUBUNIT: Homotrimer (By similarity).

-:- SUBCELDULAR LOCATION: Type II membrane protein. Also exists centracellular soluble form (By similarity).

-:- PTM: The soluble form darives from the membrane form by proteolytic processing (By similarity).

-:- SIMILARITY: Belongs to the tumor necrosis factor family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This SWISS-PROT entry is copyright.                                                                receptors (By similarity).
-!- DOMAIN: The SPOC domain, which mediates the interaction with NCOR2, is essential for the repressive activity.
-!- SIMILARITY: Belongs to the Spen family.
-!- SIMILARITY: Contains 1 RID (receptor interacting) domain.
-!- SIMILARITY: Contains 4 RNA recognition motif (RRM) domains.
-!- SIMILARITY: Contains 1 SPOC domaint.
-!- SIMILARITY: Contains 1 SPOC domaint.

L. PUNCTION: Vytokine that binds to LIBR/TURRSP3. May play a specific in immune response regulation. Provides the membrane and for the attachment of the heterotrimeric complex to the cell surface. Isoform 2 is probably non-functional.

C. SUBUNIT: Heterotrimer of either two LTB and one LTA subunits (Less prevalent) one LTB and two LTB and one LTA subunits.

C. SUBCELLUIAR LOCATION: Type II membrane protein (Potential).

-:- TISSUE SPECIFICITY: PREDOMINANTLY EXPRESED IN THE SPLEEN BUTTISSUES SPECIFICITY: PREDOMINANTLY EXPRESSED IN PERIPHERAL LYMPHOLD

TISSUES AND IN HERRI, PLACENTA, LIVER, LUNG, APPENDIX, AND KIND NO EXPRESSION SEEN IN FETAL TISSUES, ENDOCRINE GLANDS, OF NONHEWATOPOIETIC TUMOR LINES.

-:- INDUCTION: UPREGULATED AFTER T-CELL ACTIVATION.

-:- PTM: N-91ycosylated.

-:- PTM: The soluble form of isoform 1 derives from the membrane by proteolytic processing.

-:- PTM: Ref.4 sequence differs from that shown due to a frameshift in position 178.

TISOUZ SPECIFICITY: Isoform a is widely expressed at similar levels in all tissues examined. Isoforms Bl and B2 are predominantly expressed in stomach although they are also detent lower levels in other tissues. Isoform C1 is stomach-specifiseform C2 is expressed at slightly higher levels in lung and stomach than in other tissues.

cfects in TNFSFS are the cause of X-linked
ciency with hyper-igM type 1 (HIGM1) [MIN:308230]. HIGM1
moglobulin isotype switch defect characterized by
concentrations of serum igM and decreased amounts of all
ypes. Affected males present at an early age (usually
first year of life) recurrent bacterial and
tici infections, including pneumocystis carini pneumonia
tiable diarrhea due to cryptosporidium infection. Despite
on treatment with intravenous immunoglobulin, the
composis is rather poor, with a death rate of about 10%
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     R LOCATION: Type II membrane protein. Also exists as an lar soluble form.
CIFICITY: Specifically expressed on activated CD4+

The sequence is that of mouse tumour necrosis factor related liga. (TRELL). TRELL or active fragments can be included with a carrier pharmaceutical compositions to treat cancer, autoimmune diseases immune responses to tissue grafts, or to stimulate or suppress th system. It is useful to screen for TRELL receptors, by labelling

Tumour necrosis factor related ligand - useful for, e.g. treating auto-immune disease and immune responses to tissue grafts.

```
The present sequence represents a TWEAK protein. The specificatic describes a method for preventing or treating an immunological di and/or inhibiting an immune response in an animal. The method con administering a TWEAK blocking agent. The method may be used for preventing and treating immune disorders associated with inapprof expression and/or activity of TWEAK. These disorders include autodiseases, acute and chronic inflammation, organ transplant reject Graft-versus-Host disease (GVHD), lymphoid cell malignancies, set other forms of shock, loss of immune responsiveness (as seen in himmunodeficiency virus (HIV) infections) and failure of the immun
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Murine, FL-TWEAK, TNF relatedness and weak ability to induce cel.

rosis Factor family receptor polypeptides and ligands - agnosis and treatment of prostate cancer and developmental

gestational abnormalities. 

Claim 40; Fig 13B; 156pp; English.

This invention describes isolated Tumor Necrosis Factor (TNF) family receptor polypeptides: APO4, APO6, APO8 and APO9 or their active fragments, and isolated TUMF related ligands I and 3 (TNRL1 and TNF their active fragments. APO4 is useful for diagnosing prostate can determining levels of APO4 in an individual. Prostate cancer can determining levels of APO4 in an individual. Prostate cancer can determining levels of APO4 in an individual. Prostate cancer can determining levels of APO4 in an individual. Prostate cancer can determining agents in diagnosis/treatment of disease by binding agents, useful in diagnosis/treatment of disease by binding agents to the polypeptide/active fragment which is extracellular, expressed on the cell surface. The binding is preferably performed vivo. APO4 polypeptides/ active fragments are also useful for scritting and antagonists by binding and observing the changer activity. Effective pharmacological agents useful in diagnosis or treatment of disease are also identified using APO4 polypeptides/ criaments and APO4 signal transducer molecules that specifically with a cycoplasmic domain of APO4 and detecting a change in level activity. The method is performed in vivo or in vitro. APO polypey are all useful for diagnosis/treatment of developmental or gestational abnormalities. APO8 was transfected to human breast carcinoma cell. MCF-7, and induced apoptosis

leic acid encoding TREPA - useful for diagnosis and autoimmune disease, tumours and inflammation.

e 123-4; 142pp; English.

ed endothelium proliferative agent (TREPA), or its agonists, are used to treat a deficit of TREPA, e.g. to healing or tissue grafting, by promoting vascularisation, e apoptosis for treating cancer and eliminating autoreactive n adjunct to cancer chemotherapy or antiviral treatment. S can also be used to target cytocoxic agents or for ation of the corresponding receptor, the nucleic acid for used to transform tumour cells to render them more. TREPA and to screen for TREPA minics. Ribozymes, antisense ies or peptides are used to treat TREPA-associated. tumours and metastases (by inhibiting vascularisation), or a wide range of autoimmune conditions, conditions or a wide range of autoimmune conditions, conditions ormal stimulation of epithelial cells (e.g. is), for birth control (inhibiting ovalation and placental other angiogenic conditions (e.g. ulcers)

The present sequence represents a TWEAK protein. The specification describes a method for preventing or treating an immunological disand/or inhibiting an immune response in an animal. The method compadministering a TWEAK blocking agent. The method may be used for preventing and treating immune disorders associated with inappropexpression and/or activity of TWEAK. These disorders include autodiseases, acute and chronic inflammation, organ transplant reject Graft-versus-Host disease (GVHD). Iymphoid cell malignancies, septother forms of shock, loss of immune responsiveness (as seen in himmunodeficiency virus (HIV) infections) and failure of the immun 2 LSIGLALACLGLLLVVVSLGSWATLSAQEPSQEELTAEDRREPPELNPQTEESQDV 26 IGLGLALACIGLILAVVSLGSRASLSAQEPAQEELVAEEDQDPSELNPQTEESQDP 62 EQLVRPRRSAPKGRKARPRRAIAAHYEVHPRPGQDGAQAGVDGTVSGWEETKINSS 86 NRLVRPRRSAPKGRKTRARRAIAAHYEVHPRPGQDGAQAGVDGTVSGWEEARINSS 122 YDRQIGEFTVIRAGLYYLYCQVHFDEGKAVYLKLDLLVNGVLALRCLEEFSATAAS · 0 Length 249; 16; Indels Score 1020; DB 3; Pred. The present invention relates to the isolation of novel human PRC polypeptides and the polynucleotide sequences encoding them. The polyneptides, agonists, antiagonists or anti-PRO antibodies are us treating benign or malignant tumours (e.g. renal, kidney, bladder breast, etc), leukaemias and lymphoid malignancies, other disords as neuronal, glial, astrocytal, hypothalamic, glandular, macrophe stromal and blastocoelic disorders, inflammatory, immune and angi disorders. The polynucleotide sequences are also useful in gene that AAU86128-AAU86162 represent the human PRO polypeptides of the inv Human, PRO, benign tumour; malignant tumour; lymphoid malignancy; leukaemia; neuronal disorder; stromal disorder; blastocoelic discinflammatory disorder; immune disorder; angiogenic disorder; cytc Thirty five nucleic acids encoding PRO polypeptides, useful for benign or malignant tumors, leukemias and lymphoid malignancies, inflammatory, anglogenic and immunologic disorders. ge 368-369; 388pp; English.

quence is the protein sequence for human TWEAK protein. The tess to compositions comprising heterotrimeric complexes of sefactor (TNF) ligand family members, and their use in the wention and treatment of disease. In one embodiment, the complex comprises full-length or extracellular portions of length or extracellular portions of the preferably VEGI or VEGI-SV. The heterotrimeric complexes on are useful for treating an autoimmune disease, cancer or and particularly for inhibiting cancer cell proliferation, or inducing apoptosis of I cells

New Endokine alpha gene useful for preparing a composition for tradisease associated with excessive or insufficient bone resorption osteoporosis, Paget's disease or arterial calcification.

Disclosure; SEQ ID NO 24; 145pp; English.

tumour necrosis factor family ligand. A composition comprising the isolated antibody or its fragment is used for treating an individuced of decreased level of endokine alpha activity. The endokine polypeptide present in a heterotrimeric complex is used for treatindividual having a disorder associated with excessive bone resort individual having a disorder associated with insufficient bone recomprises administering an endokine alpha antagonist, which is the antibody that binds specifically to endokine alpha polypeptide. It The invention relates to an isolated nucleic acid molecule encoding

ď,

ince represents the amino acid sequence of a tumour necrosis

death or treat, suppress or alter immune responses (especially i) human adenocarcinoma cells) involving a signal pathway between T its receptor. It's coding sequence can be used in gene therapy for related disorders in mammals (especially humans), e.g. tumours, autoimmune and inflammatory diseases or inherited genetic disord introducing into cells, and expressing, therapeutically effective a vector, e.g. a virus comprising a gene encoding TRELL. It must be of use in the preparation of prepare probes for screening natural/synthetic DNAs for TRELL-encoding sequences and for anti-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Tumour necrosis factor receptor; signal transducer molecule; TNF developmental abnormality; gestational abnormalitity; prostate c. eptides: ADO4, ADO6, ADO8 and ADO9 or their active isolated TNR related ligands 1 and 3 (TNRL1 and TNRL3) or ragments. ADO4 is useful for diagnosing prostate cancer by vels of ADO4 in an individual. Prostate cancer can also be APO4 selective binding agents linked to a therapeutic olypeptides are also useful for identifying selective. Useful in diagnosis/reatment of disease by binding of polypeptides/active fragment which is extracellular, or he cell surface. The binding is preferably performed in ypoptides/ active fragments are also useful for screening an antagonists by binding and observing the changer in APO4 cive pharmacological agents useful in diagnosis or isease are also identified using APO4 polypeptides/active APO4 signal transducer molecules that specifically interact smic domain of APO4 and detecting a change in level of APO4 method is performed in vivo or in vitro. APO polypeptides as immunogens for preparing antibodies. APO4 is also gnosis/treatment of developmental or gestational describes isolated Tumor Necrosis Factor (TNF) family uced apoptosis

```
The sequence represents a fusion protein encoded by the expression vector pDC409-LZ-TWEAK. The fusion protein comprises a growth horm leader, a leucine zipper multimerisation domain, and the extracell domain of human TWEAK. The fusion protein was used in the isolatic human TWEAK receptor (TWEAKR)-expressing clones from a COS cell human TWEAK receptor (TWEAKR)-expressing clones from a COS cell human TWEAK receptor (TWEAKR) expressing clones from a COS cell human TWEAK receptor (TWEAKR) gonists a member of the tumour necrosis (TWF) family and induces angiogenesis. TWEAKR may therefore be use screen for and develop TWEAKR agonists and antegonists for the moc of angiogenesis, to be used in the treatment and diagnosis of human disopenesis, to be used in the treatment and diagnosis of human covascular glaucoma, retinoblastoma, retinopathy of prematurity, retrolental fibroplasia, rubeosis, uveitis, macular degeneration are conneal graft neovascularisation, and inflammatory diseases such a arthritis, rheumatism and psoriasis. Other treatable diseases inclemalignant and metastatic conditions such as sarcomas and carcinome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Modulating angiogenesis in a mammal for treating diseases mediated angiogenesis, e.g. solid tumors and vascular deficiencies of cardiperipheral tissue, by administering antagonist or agonist of TWEAP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Example 1; Page 41; 46pp; English.
